SAP DATA INTEGRATION SOLUTION

SAPConnect Pro

One connector platform. Four proven paths to extract data from any SAP system — into Snowflake, Databricks, or the lakehouse of your choice.

SAPConnect Pro gives data engineering teams a single, enterprise-grade solution for extracting data out of SAP ECC, S/4HANA, and BW landscapes. Rather than forcing every workload through one rigid integration pattern, SAPConnect Pro offers four purpose-built extraction methods — Direct DB Connect, OData Services, CDS Views, and a CDC Connector — so you can match the right approach to each source, workload, and latency requirement.

Four Ways to Connect

Pick the extraction method that fits the workload — or combine all four across your landscape

Direct DB Connect

Native JDBC/ODBC access straight into the underlying SAP HANA or database layer for high-volume, bulk extraction and custom SQL pushdown.

OData Services

Standards-based REST/OData v2 & v4 endpoints via SAP Gateway — lightweight, metadata-driven access ideal for app integration and on-demand lookups.

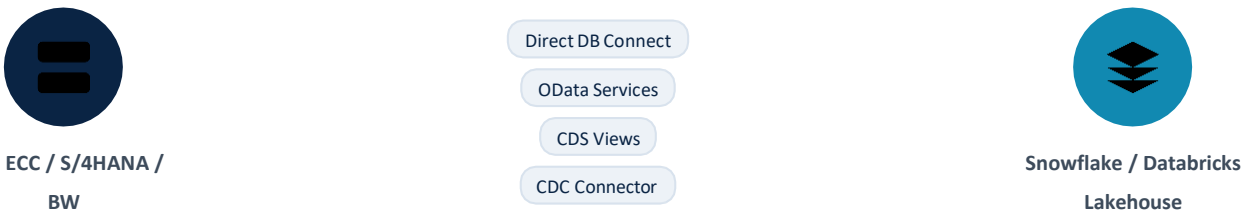

CDS Views

Extraction through SAP's semantically rich Core Data Services layer, preserving business logic, associations, and authorization checks in S/4HANA.

CDC Connector

Log-based change data capture that streams only what changed — near real-time delta loads with minimal impact on production SAP systems.

HOW IT FITS TOGETHER

Features C Benefits by Connector

A closer look at what each extraction method delivers — and why it matters for your data plaVorm

Method	Key Features	Benefits
Direct DB Connect	• Native JDBC/ODBC connectivity to SAP HANA & source DB • Bulk, high-throughput extraction for large tables • Custom SQL pushdown & schema introspection	• Fastest option for large historical / full-load extracts • No middleware layer — full control over query logic • Lowest total extraction time for petabyte-scale tables
OData Services	• REST-based OData v2 & v4 endpoints via SAP Gateway • Metadata-driven schema discovery • Built-in filtering, pagination & batch requests	• Lightweight, standards-based — no direct DB access needed • Ideal for real-time lookups and app-to-app integration • Faster to stand up for smaller, targeted datasets
CDS Views	• Extracts through SAP's semantic Core Data Services layer • Exposes analytical & transactional S/4HANA views • Preserves associations and authorization checks	• Business-context-aware data reduces re-engineering of rules • Faster time-to-value for S/4HANA-based sources • Consistent with SAP-native reporting logic
CDC Connector	• Log-based change data capture with delta watermarks • Near real-time streaming to the lakehouse • Supports SAP ECC & S/4HANA source tables	• Minimizes load on production SAP systems • Keeps downstream lakehouse continuously fresh • Eliminates most full-reload maintenance windows

Why Teams Choose SAPConnect Pro

Performance at Scale

Bulk and delta paths tuned for enterprise SAP data volumes.

Enterprise Security

SAP-native auth (SSO/SNC) and encryption in transit and at rest.

Near Real-Time Freshness

CDC-based delta loads keep analytics current, not day-old.

One Platform, Any Landscape

Works across ECC, S/4HANA, and BW without re-architecting.
