SemantIQ

SEMANTIC LAYER AUTOMATION · AI AGENT

# Turn scattered schemas into one shared meaning —

**10x**
Faster semantic model design vs. manual mapping workshops

**1**
Unified business vocabulary across every source system

**0**
Manual re-mapping when a source schema changes

**100%**
Lineage-traceable from raw field to business metric

## Why teams bring in SemantIQ

Every AI initiative — copilots, RAG, BI, agents — eventually needs the same thing: a semantic layer that maps raw tables to business meaning. Today that's weeks of manual workshops. SemantIQ does it as an always-on agent.

### Understands, not just maps

Reads schema, sample data, and usage patterns to infer real business meaning — not just column names.

### One model, every source

SAP, Banner, Salesforce, Snowflake, Databricks and more — reconciled into a single conformed model.

### Stays current on its own

Detects schema drift and source changes, and re-proposes semantic updates before anything breaks downstream.

CAPABILITIES

# Everything a semantic layer needs — designed by the agent, not a committee

SemantIQ handles the full lifecycle: discovery, modeling, natural-language mapping, governance, and drift monitoring, so your data and AI teams start from a trusted model instead of building one from scratch.

### Automated entity & relationship discovery

Scans tables, keys, and joins across sources to auto-detect entities, hierarchies, and grain — no manual ERD required.

### Business glossary & metric standardization

Generates consistent definitions for KPIs like "Net Revenue" or "Active Customer" and reuses them everywhere.

### Continuous sync & drift detection

Monitors source schemas around the clock and proposes semantic updates the moment something changes.

### Natural-language to semantic query mapping

Translates plain-English business questions into governed queries against the semantic layer for any AI agent or copilot.

### Governance & version control

Every semantic change is versioned, reviewable, and approvable — with full lineage back to the source field.

### Multi-source schema unification

Reconciles naming, grain, and currency/unit differences across ERP, CRM, and lakehouse platforms into one model.

## How it works

1

### Connect

Point the agent at source systems and existing catalogs — no manual extracts.

2

### Discover

Agent profiles data, infers entities, keys, and relationships automatically.

3

### Model

Proposes a conformed semantic layer with business-friendly names and metrics.

4

### Govern & serve

Teams review and approve; the model is versioned and served to any AI or BI tool.

> What used to take our team six weeks of cross-functional workshops to align on a shared data model, SemantIQ now proposes — reviewed and refined — in under three days.

> — VP of Data & Analytics, Enterprise Software Company

## Works with the platforms you already run

SAP (FICO / SD / MM / SCM) · Banner ERP · Salesforce · Snowflake · Databricks · Power BI · Tableau · Any LLM / AI Agent

## Ready to see your data speak one language?

Book a working session and SemantIQ will draft a live semantic model from one of your own sources.
